

Save BIG \$\$ by Converting Small Detail Parts to Clow's Short Run Stamping Process

At Clow Stamping Company (www.clowstamping.com), we provide high quality, cost effective metal stampings. With over 60 presses and a capacity range up to 400 tons, Clow Stamping Company is uniquely qualified to provide significant cost reduction on metal components that have traditionally been manufactured in Laser or CNC Turret operations. Short run stamping offers significant cost savings to companies with in house metal fabrication. Tooling and piece part costs are kept to a minimum through the use of common holders, common forming tools and a process which yields significantly more pieces per hour. Short run stamping also allows for economical design changes.

Part Conversion

For example, the part pictured on the left is used in the recreational industry. At a 2,500 piece release, each part cost approximately \$1.45 (with a \$1,000 tooling charge). In comparison, the soft tool turret press price on 2,500 pieces would be \$2.65, with no additional tooling charges. By switching to short run stampings, our client generated an \$11,000 savings (on 10,000 pieces annually). Imagine if you had 10 parts like this! You could generate over \$110,000 a year in savings. Want to be a hero in your organization? Contact Clow Stamping to learn more about our short run stamping advantage.
